

## **1. What I gained from the Industrial Talk**

Through the talk, I learned about Credence, a company powered by Telekom Malaysia (TM) with a specific focus on analytics and cloud services.

Other than that, I gained insights about the technology and tools used at Credence. For example, PostgreSQL, ClickHouse, Druid, Tableau, PowerBI, Metabase, Superset, Airflow and Spark. These technologies and tools allow Credence to establish a comprehensive data ecosystem, enabling informed decision-making and strategic insights.

## **2. Suggestions**

It would be advantageous to conduct a session on career development. For example, Credence could offer guidance on the skills and qualifications sought after in the industry. They could also provide tips and strategies on aligning student profiles with industry needs.

Other than that, providing networking opportunities during the talk would be beneficial. For example, Credence could arrange networking sessions where students can connect with professionals from Credence and other companies in the sector. This could facilitate mentorship opportunities and encourage knowledge exchange.

## **3. Others**

In conclusion, from this talk, I gained a lot of information, insights and motivation. This has inspired me to be a versatile and skilled system developer. I will continuously improve myself by participating in relevant training programs and obtaining certifications. I also plan to contribute to open-source projects, engage in collaborative coding endeavours and gain real-world project experiences.
